THE RELATIONSHIP BETWEEN LEADERSHIP STYLE AND VOLUNTEER INTENTION TO STAY

Mark E. Smith
Olivet Nazarene University
Ed.D. Cohort 11
April 22, 2017
Introduction

Volunteerism - a crucial element for many organizations, especially nonprofit services-focused organizations (Vecina, Chacón, Marzana, & Marta, 2013)

Civil Air Patrol (CAP) is a nationwide volunteer organization with over 58,000 adult and youth members (Civil Air Patrol, 2014b)

CAP experiencing similar dynamics to the broader literature
  - Declining membership with poor leadership often the stated reason for leaving (Civil Air Patrol, 2014a)
Volunteer membership in CAP has been declining, and a frequently-cited reason for change in membership is poor leadership (Civil Air Patrol, 2014a).

The decline in membership may be due in part to inadequate skills of volunteer leaders.

Characterizing and correcting shortfalls in volunteer leadership skills may lead to improved member retention and strengthened performance of CAP’s three congressionally-chartered missions.
The purpose of the current study was to examine CAP current adult and youth volunteer members' perceptions of the qualities of their squadron commander’s servant leadership in order to determine the relationship between leadership style and volunteer retention.
Research Question 1

1. What is the relationship between leadership style and adult volunteer intention to stay?

H₁: There is a relationship between leadership style and adult volunteer intention to stay.
2. What is the relationship between leadership style and youth volunteer intention to stay?

H₂: There is a relationship between leadership style and youth volunteer intention to stay.
3. What is the relationship between the Civil Air Patrol (CAP) member status of leader, adult volunteer, or youth volunteer, and the scores reflected on the Servant Leadership Scale?

H₃: Adult volunteers and youth volunteers will rate their leaders in a similar manner as reflected by their scores on the Servant Leadership Scale.

H₄: Leaders will rate themselves at a similar level as adult volunteers and youth volunteers rate their leaders as reflected by their scores on the Servant Leadership Scale.
Research Design

Quantitative research design
- Correlational research approach for Q1 and Q2 (Salkind, 2012)
- Inferential research approach for Q3 (Salkind, 2014)

Instrument: 34 items
- *Servant Leadership Scale*: 28 items for 7 leadership factors (Liden, Wayne, Zhao, & Henderson, 2008)
- Single item for intention to stay (Schneider & George, 2011)
- Demographics: gender, age, length of service, and race/ethnicity

Simple random sampling (Leedy & Ormrod, 2013) to select 200 individuals from each of 3 groups: leaders, adult volunteers, and youth volunteers
Data Collection

Pilot study conducted to provide confidence that reliability and validity were not compromised. Same procedures as general study

Leaders and adult volunteers received email invitation to online survey
  • Two month window to complete. Reminder emails at 4 weeks and 6 weeks
  • Both groups incentivized with chance to win $100 gift card

Youth volunteers received packages mailed to their home addresses
  • Two month window to complete. Written reminder at one-month point
  • Incentivization with $100 gift card provided for youth volunteer group
Correlational analyses were conducted between leaders and adult volunteers, and between leaders and youth volunteers.

- Assess the correlations between the ratings provided by participants regarding the servant leadership categories.

Spearman’s Rho was utilized for correlational analyses between leadership categories and the intention to remain rating (Gay, Mills, & Airasian, 2012).
Data Analysis

Research Question Three

Inferential analyses conducted by use of one-way ANOVA calculations

- Independent variables: member status (leader, adult volunteer, or youth volunteer) and the seven categories of servant leadership
- Dependent variable: The ratings of the seven servant leadership categories

Regarding gender, a factorial ANOVA was conducted with group and gender of participant serving as the independent variables and aggregated Servant Leadership Scale scores serving as the dependent variable
Findings – Research Question 1

Positive, statistically significant correlation between servant leadership and adult volunteer intention to stay at the aggregate level ($r_s(48) = .44$, $p = .002$) and for each of the seven servant leadership factors.

*Note: $n = 48$  \*$p < .05$

<table>
<thead>
<tr>
<th>Servant Leadership Factor</th>
<th>$r_s$</th>
<th>$p$</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conceptual Skills</td>
<td>.51*</td>
<td>&lt; .001</td>
</tr>
<tr>
<td>Empowering</td>
<td>.35*</td>
<td>.02</td>

<tr>
<td>Emotional Healing</td>
<td>.36*</td>
<td>.01</td>
</tr>
<tr>
<td>Creating Value for the Community</td>
<td>.33*</td>
<td>.02</td>
</tr>
</tbody>
</table>
The correlation between servant leadership and youth volunteer intention to stay was not statistically significant ($r_s(42) = .25, p = .16$).

A statistically significant relationship existed for only one of the seven servant leadership factors and youth volunteer intention to stay:

- **Conceptual Skills**: $r_s = .28$, $p = .08$
- **Empowering**: $r_s = .27$, $p = .09$
- **Helping Subordinates Grow and Succeed**: $r_s = .25$, $p = .12$
- **Putting Subordinates First**: $r_s = .20$, $p = .22$
- **Behaving Ethically**: $r_s = .32^*$, $p = .04$
- **Emotional Healing**: $r_s = .29$, $p = .07$
- **Creating Value for the Community**: $r_s = .28$, $p = .07$

*Note: $n = 42$  \  *$p < .05$
A series of one-way ANOVAs indicated statistically significant differences in the means in the ratings of leaders, adult volunteers, and youth volunteers in six of the servant leadership factors.*

*p < .05
Findings – Research Question 3

Post hoc testing conducted to determine where the differences in means existed

Hypothesis 3: Statistically significant difference in mean in only one of the six servant leadership factors for adult volunteers and youth volunteers.

Hypothesis 4: Means of leaders’ scores were higher at statistically significant levels than adult volunteers for five of the seven servant leadership factors.

Hypothesis 4: Means of leaders’ scores were higher at statistically significant levels than youth volunteers for four of the seven servant leadership factors.
A factorial ANOVA was performed to determine if there were gender-based differences in the scores of the three membership categories.

- Gender effects canceled out at the aggregated level of all three groups ($F_{(1,180)} = .203, p = .653$)

- Effect of gender on groups was statistically significant ($F_{(2,180)} = 4.31, p = .015$)

Conclusions – Research Questions 1 and 2

Hypothesis 1 was supported

- A positive relationship existed between leadership style and intention to stay for adult volunteers
- Past studies have revealed similar findings (Schneider & George, 2011; Stirling, et al., 2011)

Hypothesis 2 was rejected

- There was not a statistically significant relationship between leadership style and intention to stay for youth volunteers
- The literature on the effects of youth volunteers is extremely limited (Montgomery, 2006)
The analysis generally supported Hypothesis 3
- No statistically significant differences in how adult volunteers and youth volunteers rated their leaders on six out of seven servant leadership factors

The results did not support Hypothesis 4
- Leaders did not rate themselves at similar levels as adult volunteers and youth volunteers rated their leaders
- One past study revealed similar findings to the current study (Bang, 2011)

Regarding gender, the results did not support Hypothesis 4
- Statistically significant gender-related differences were found between how adult volunteers and youth volunteers rated their leaders
- One past study revealed similar findings (e.g., Waters & Bortree, 2011)
Implications

Adult Volunteers
CAP should modify its leadership training to equip its leaders to operate using the principles of servant leadership; focus on local leaders.

Youth Volunteers
Test design may be the reason for no relationship between youth volunteer scores on the Servant Leadership Scale and intention to stay.

Leaders had a much higher opinion of their leadership qualities than what the adult and youth volunteers thought.

Gender-based differences in responses to leadership.
Recommendations

Cluster sampling to examine directly the relationship between leader self-report and volunteer assessment of the leader

Longitudinal studies to understand whether volunteers’ assessments of servant leadership traits or intentions to stay change over time

Investigating other types of volunteer organizations would be insightful; CAP is highly structured and bureaucratic

Limited literature on youth volunteers – more research is required

Further research is needed to characterize differences that may exist in how male and female volunteers respond to leadership style
